Things to do today

01 Lecture Notes (Ch.7, Ch.8~9)
- Conditional statements & Functions

02 Modular Programming

03

MONOLITHIC ROBOT

- Made as one solid piece
- Parts cannot be separated
- If one part breaks,
  you have to replace the whole robot

monolithic.c

```c
#include <stdio.h>

int main(void) {
    printf("Robot: Move arms\n");
    printf("Robot: Move legs\n");
    printf("Robot: Move head\n");
    printf("Robot: Smile\n");

    return 0;
}
```

MODULAR ROBOT

- Made from separate parts
- Each part can be attached or detached
- You can replace or upgrade only the part that needs repair
- Easy to add new functions with extra parts

modular.c

```c
#include <stdio.h>

void moveArm(void) {
    printf("Robot: Move arms\n");
}
void moveLeg(void) {
    printf("Robot: Move legs\n");
}
void moveHead(void) {
    printf("Robot: Move head\n");
}

int main(void) {
    moveArm();
    moveLeg();
    moveHead();
    return 0;
}
```

UPGRADE & EXPANSION ROBOT

- Add new parts to get new functions
- Upgrade specific parts without changing the whole robot
- Combine different parts for special abilities
- Keep the original robot and extend its features

upgrade.c

```c
#include <stdio.h>

void moveArm(void) {
    printf("Robot: Move arms\n");
}
void moveLeg(void) {
    printf("Robot: Move legs\n");
}
void moveHead(void) {
    printf("Robot: Move head\n");
}

void fly(void) {
    printf("Robot: Fly with wings\n");
}

void launchRocket(void) {
    printf("Robot: Launch rocket\n");
}

int main(void) {
    moveArm();
    moveLeg();
    moveHead();
    fly();
    launchRocket();
    return 0;
}
```

See you next week!
DO NOT miss the classes
